Android color red. Android color.parseColor. Android parse color.

```

2021-64 android.hud Android has 2 types of colors: R.color and Color Layout uses R.color (I need both blue light: 17170450 {0x01600012}) but functions (such as setColor()) have the other type of input int (e.g. CYAN: -16711681 {0xff00ffff}). Negation of R.color returns incorrect colors. What should I do to convert them? Since getResources().getColor() is now deprecated, you can use: ContextCompat.getColor(getResources(), R.color.idOfColor) old answer Use getResources().getColor(R.color.idOfColor); it returns the int color you are looking for. If the colour comes with Android you can get its id with android.R.color.colorId Color from resources you get through getResources().getColor(R.color.color_id): Color that you have saved from a view (say background color or text color), which will look like your second example, you may get through Color.parseColor(String color) 采集自互联网，如有侵权请联系站长删除。 449297764644d08c6a61ee1ac3d97cd260123 [file] [log] [blame]** Copyright (C) 2008 The Android Open Source Project.
